

Care and cleaning EUROFLEX Products

Regular cleaning of your installed EUROFLEX surface will promote a long life as well as an attractive appearance.

Impurities can be cleaned with a soft-bristled broom or vacuuming with an industrial vacuum cleaner.

Once a year, it is recommended to use a high pressure water cleaner with a **maximum** of 200bar (2,900 psi).

Do not use chemical cleaners.

The distance of water jet to the surface area should be minimum 30cm (11 ¾") and the water temperature no higher than 80°C (176°F).

Adherent impurities can be scrubbed of with water and a diluted solution of water and vinegar if needed. Rinse thoroughly with water afterward.

Snow removal: avoid using heavy machinery or sharp edged tools which may damage the surfacing. De-icing salt won't hurt the surface.

Do **not** use solvent based cleansing material, as it will damage the surface of the tiles.
